BEAM / TWISTED PIXEL

Start here

Your first Beam study, in four steps.

0.13.0 | Internal Production Beta | Still in testing

1 Install Beam

Install/beam-0.13.0.zip

In Blender, open Preferences > Add-ons > menu > Install from Disk. Select this ZIP and enable Beam. Keep the ZIP zipped. Restart Blender after replacing an older build.

2 Take the Quick Start

Beam_Quick_Start.pdf

Follow the two-page walkthrough to create a screen, place a projector and build your first layout.

3 Try the guided exercises

Beam_Training_Project.blend

Open the training scene, then use File > Save As to make a working copy. Follow Beam_Training_Project_Guide.pdf alongside it. The original file is your reset point.

4 Keep the full manual nearby

Beam_User_Guide.pdf

Use the full guide for detailed workflows and the Where is it reference. Screenshots are included in the guides; no separate image files are needed.

Tested with Blender 5.2.2 LTS / macOS 26.7.

Work on copies and verify your study before production use.
